A. Fill in the blanks in each of the following statements [Score: 20]:

1. A base class’s __protected________________ members can be accessed only in the base-class definition or in derived-class definitions.

2. In a(n) ______has-a_____________ relationship, a class object has one or more objects of other classes as members.

3. In single inheritance, a class exists in a(n) _hierarchical_________________ relationship with its derived classes.

4. __Private__________________________ inheritance can be used as an alternative to composition.

5. A base class’s________public________________ members are accessible anywhere that the program has a handle to an object of that base class or to an object of one of its derived classes.

6. C++ provides for __________multiple inheritance___________, which allows a derived class to inherit from many base classes, even if these base classes are unrelated.

7. When an object of a derived class is instantiated, the base class’s __constructor_________________ is called implicitly or explicitly to do any necessary initialization of the base-class data members in the derived-class object.
8. When deriving a class from a base class with \textbf{protected} inheritance, public members of the base class become \underline{\textbf{protected}} members of the derived class, and protected members of the base class become \underline{\textbf{protected}} members of the derived class.

9. Classes from which objects cannot be instantiated are called \underline{\textbf{abstract}} classes.

10. \underline{\textbf{dynamic	extunderscore cast}} operator can be used to downcast base-class pointers safely.

11. Operator \textbf{typeid} returns a reference to a(n) \underline{\textbf{type	extunderscore info}} object.

12. \underline{\textbf{Polymorphism}} involves using a base-class pointer or reference to invoke virtual functions on base-class and derived-class objects.

13. Casting a base-class pointer to a derived-class pointer is called \underline{\textbf{downcasting}}.

14. Templates enable us to specify, with a single code segment, an entire range of related functions called \underline{\textbf{function template specializations}}, or an entire range of related classes called \underline{\textbf{class template specializations}}.

15. The related functions generated from a function template all have the same name, so the compiler uses \underline{\textbf{overloading}} resolution to invoke the proper function.

16. Class templates also are called \underline{\textbf{parameterized}} types.

17. The operator is used with a class-template name to tie each member function definition to the class template’s scope.

18. As with \textbf{static} data members of non-template classes, \textbf{static} data members of class-template specializations must also be initialized at \underline{\textbf{file}} scope.

19. The two types of STL containers are \underline{\textbf{sequence}} containers and \underline{\textbf{associative}} containers.

20. The three STL adapters are \underline{\textbf{stack}}, \underline{\textbf{queue}}, and \underline{\textbf{priority	extunderscore queue}}.
B. Multiple Choice Questions [Score: 60]:

1. If the functions \( a() \), \( b() \) and \( c() \) all return references to an object \( \text{Test} \) (using the \( \text{this} \) pointer) and function \( d() \) is declared \( \text{void} \), which of the following statements has correct syntax?
   (a) \( a().b().\text{Test}; \)
   (b) \( \text{Test}.d().c(); \)
   (c) \( \text{Test}.a().\text{Test}.d(); \)
   (d) \( \text{Test}.a().b().d(); \)

2. Assume we have a base class \( \text{Shape} \) and derived classes \( \text{Triangle} \) and \( \text{Circle} \). Which of the following member functions should be \( \text{virtual} \)?
   (a) \( \text{radius} \)
   (b) \( \text{calculateArea} \)
   (c) \( \text{perimeter} \)
   (d) both (b) and (c)

ANS: (d)

3. The main difference between a pure virtual function and a virtual function is
   (a) the return type
   (b) a pure virtual function cannot have an implementation.
   (c) the inheritance properties
   (d) the location in the class.

ANS: (b)

4. Which statement is \( \text{false} \) about dynamic binding?
   (a) It allows independent software vendors to hide proprietary secrets.
   (b) It eliminates the usefulness of separate header and source files.
   (c) It allows software developers to derive new classes compatible with existing software.
   (d) The program chooses the correct functions at execution time, rather than compile time.

ANS: (b)

5. Which of the following is \( \text{false} \)?
   (a) with a non-template class, one copy of a \( \text{static} \) data member is shared among all objects created from that class
   (b) each template class instantiated from a class template has its own copy of each \( \text{static} \) data member
   (c) \( \text{static} \) data members of both template and non-template classes need to be initialized at file scope
   (d) \( \text{static} \) member functions are shared between each class-template specialization in the class template.

ANS: (d)

6. For a non-empty linked list, select the code that should appear in a function that adds a node to the end of the list. \( \text{newPtr} \) is a pointer to the new node to be added, and \( \text{lastPtr} \) is a pointer to the current last node. Each node contains a pointer \( \text{nextPtr} \), a link to a node.
   (a) \( \text{lastPtr}\rightarrow\text{nextPtr} = \text{newPtr}; \)
       \( \text{lastPtr} = \text{newPtr}; \)
   (b) \( \text{lastPtr} = \text{newPtr}; \)
       \( \text{lastPtr}\rightarrow\text{nextPtr} = \text{newPtr}; \)
   (c) \( \text{newPtr}\rightarrow\text{nextPtr} = \text{lastPtr}; \)
lastPtr = newPtr;
(d) lastPtr = newPtr;
   newPtr->nextPtr = lastPtr;

ANS: (a)

7. Which of the following is most likely a base-class of the other three?
   (a) automobile
   (b) convertible
   (c) miniVan
   (d) sedan

ANS: (a)

8. Assuming the definition,
   
   class Circle : public Point
   
   which of the following is false?
   (a) the colon (:) in the header of the class definition indicates inheritance
   (b) the keyword public indicates the type of inheritance
   (c) All the public and protected members of class Circle are inherited as public and protected members, respectively, into class Point
   (d) Point is the base class and Circle is the derived class

ANS: (c)

9. Suppose class A inherits from base class B. What is the order in which for the constructors and destructors will be called when an object of class A is instantiated then destroyed?
   (a) B constructor, A constructor, A destructor, B destructor
   (b) B constructor, A constructor, B destructor, A destructor.
   (c) A constructor, B constructor, B destructor, A destructor.
   (d) It depends on the order in which the object of class B appears on class A's member initializer list.

ANS: (a)

10. Employee is a base class and HourlyWorker is a derived class, with an overridden print function. Given the following statements, will the output of the two print function calls be identical?
    
    HourlyWorker h;
    Employee *ePtr = &h;
    ePtr->print();
    ePtr->Employee::print();

    (a) yes, if print is a virtual function.
    (b) no, if print is a non-virtual function.
    (c) yes, if print is non-virtual function.
    (d) both (a) and (c)

ANS: (c)

11. The line
    
    virtual double earnings() const = 0;

    appears in the class definition. You cannot deduce that
    (a) a derived class will override this method.
    (b) the class is an abstract class.

ANS: (a)
(c) the class is probably generic.
(d) other classes are probably derived from this one.
ANS: (a)

12. Abstract classes
   (a) contain only one pure virtual function.
   (b) can have objects instantiated from them if the proper permissions are set.
   (c) cannot have abstract derived classes.
   (d) are defined, but the programmer never intends to instantiate any objects them.
ANS: (d)

13. Function-template specializations
   (a) share one copy of the function template.
   (b) are generated by the compiler.
   (c) have a maximum allowed number of type parameters.
   (d) are not more concise than the equivalent set of overloaded functions.
ANS: (b)

14. A function template can be overloaded by
   (a) using other function templates with the same function name and parameters.
   (b) using non-template functions with the same name and different parameters.
   (c) using non-template functions with the same name and the same parameters.
   (d) using other function templates with a different name but the same parameters.
ANS: (b)

15. Non-type parameters are
   (a) unable to have default arguments
   (b) specified before the type parameter
   (c) const
   (d) not optional for class templates
ANS: (c)

16. Which of the following is false?
   (a) with a non-template class, one copy of a static data member is shared among all objects created from that class
   (b) each template class instantiated from a class template has its own copy of each static data member
   (c) static data members of both template and non-template classes need to be initialized at file scope
   (d) static member functions are shared between each class-template specialization in the class template.
ANS: (d)

17. Exception handling allows a program to
   (a) terminate in a controlled manner
   (b) be more robust and fault-tolerant
18. Once an exception is thrown, when can control return to the throw point?
   (a) never
   (b) only if the exception was caught
   (c) use braces {}
   (d) always
   ANS: (a)

19. The catch(...) statement is
   (a) always executed regardless if an exception is thrown.
   (b) only executed if it is the last catch statement and an exception is thrown and possibly caught by a previous catch handler in the same sequence.
   (c) only executed if an exception is thrown and precedes the try block.
   (d) always executed if it is the first in a list of catch blocks and an exception is thrown.
   ANS: (d)

20. The correct order in which an exception is detected and handled is
   (a) try, catch, throw
   (b) throw, catch, try
   (c) catch, throw, try
   (d) try, throw, catch
   ANS: (d)

21. The try block does not
   (a) enclose the code that may throw the exception.
   (b) enclose the catch block.
   (c) test nested try blocks for additional catch statements
   (d) have exceptions explicitly or implicitly thrown in the try block itself.
   ANS: (b)

22. The purpose of stack unwinding is to
   (a) attempt to catch exceptions that are not caught in their scope.
   (b) improve catch blocks by allowing them to handle multiple exceptions.
   (c) return control to the function that created the exception.
   (d) aid the terminate command in shutting down the program.
   ANS: (a)

23. If dynamic memory has been allocated for an object and an exception occurs, then
   (a) the catch block will not work properly.
   (b) a memory leak could result.
   (c) the object's constructor will cause another exception.
   (d) multiple pointers to memory could be created.
   ANS: (b)

24. Which file open mode would be used to write data only to the end of an existing file?
   (a) ios::app
   (b) ios::in
25. Select the false statement
   (a) C++ imposes no structure on a file.
   (b) C++ files include information about their structure.
   (c) The programmer must impose a structure on a file.
   (d) C++ files do not understand notions such as "records" and "fields."
ANS: (b)

26. Which of the following is not a disadvantage of trying to modify a sequential access file?
   (a) modifying data can potentially destroy other data.
   (b) overwriting a record with another record of the same size is very difficult
   (c) it may be necessary to modify every record in the file to make a slight change
   (d) something which is stored in the same number of "raw data" bytes internally may not take up the same amount of space in a file.
ANS: (b)

27. What is not true about this code segment?
   ```
   location = fileObject.tellg();
   ```
   (a) tellg is a member function of fileObject.
   (b) location is a pointer.
   (c) the value of location must be less than or equal to the number of bytes in the file.
   (d) fileObject is an istream object.
ANS: (b)

28. Random access files are more effective than sequential files for
   (a) instant access to data
   (b) updating data easily
   (c) inserting data into the file without destroying other data
   (d) all of the above
ANS: (d)

29. For an ifstream object inCredit, a class type clientData and a clientData structure client, the proper way read in one class is
   (a) inCredit.read(&client, sizeof( clientData ) );
   (b) inCredit.read( reinterpret_cast<char *>( &client ), sizeof( clientData ) );
   (c) inCredit.read( reinterpret_cast<char *>( &client ), clientData);
   (d) inCredit.read(char * ( &client ), sizeof( clientData ) );
ANS: (b)

30. Select the proper object type.
    ```
    _______ file("file.dat", ios::in | ios::out);
    ```
    (a) istream
    (b) fstream
    (c) ofstream
    (d) ifstream
ANS: (b)
31. Select the false statement. When objects are saved to a file
(a) only data is returned about the object, not type information.
(b) they can be read from the file at a later time.
(c) different types of objects cannot be written to the same file.
(d) it is often necessary to output the object’s type as well.
ANS: (c)

32. Given the line

```cpp
delete newPtr;
```

what can you conclude?
(a) The memory referenced by `newPtr` is released only if it is needed by the system.
(b) `newPtr` is of type `void *`.
(c) `newPtr` only exists if there was an error freeing the memory.
(d) `newPtr` still exists.
ANS: (d)

33. _________ is not an advantage of linked lists when compared to arrays.
(a) Dynamic memory allocation
(b) Efficient insertion and deletion
(c) Direct access to any list element
(d) Efficient use of memory
ANS: (c)

34. Iterators are similar to pointers because of the
(a) * and ++ operators.
(b) -> operator.
(c) `begin` and `end` functions.
(d) & operator.
ANS: (a)

35. Which of the following is a difference between vectors and arrays?
(a) access to any element using the [] operator
(b) contiguous blocks of memory
(c) the ability to change size dynamically
(d) efficient, direct-access
ANS: (c)

36. Which of the following is not a sequence container provided by the STL?
(a) `vector`
(b) `array`
(c) `list`
(d) `deque`
ANS: (b)

37. Class `deque` provides
(a) efficient indexed access to its elements
(b) the ability to add storage at either end of the deque
(c) efficient insertion and deletion operations at its front and back
38. The main difference between `set` and `multiset` is
   (a) their interface.
   (b) that one deals with keys only, and the other deals with key/value pairs.
   (c) their efficiency.
   (d) how they handle duplicate keys.
   ANS: (d)

39. The difference between maps and sets is that
   (a) the elements of `multimaps` and `maps` are pairs of keys and values instead of individual values
   (b) the elements of `multisets` and `sets` are pairs of keys and values instead of individual values
   (c) `multimaps` and `maps` can be ordered using comparator functions and `multisets` and `sets` can not
   (d) `multisets` and `sets` can be ordered using comparator functions and `multimaps` and `maps` can not
   ANS: (a)

40. Select the false statement. Container adapters
   (a) do not provide the actual data structure implementation for elements to be stored.
   (b) have an underlying data structure.
   (c) can all push and pop elements.
   (d) have limited iterator support.
   ANS: (a)

41. A queue receives the following commands (in pseudo-code):
    
```
    enqueue 4, 6, 8, 3, 1  (4 is the first element to be enqueued)
    dequeue 3 elements
    enqueue 3, 1, 5, 6
    dequeue 2 elements
```

What number is at the front of the queue?
   (a) 3
   (b) 4
   (c) 5
   (d) 6
   ANS: (a)

42. Multiple inheritance means that a derived class inherits the members of several __________.
   (a) derived classes
   (b) public classes.
   (c) direct base classes.
   (d) indirect base classes, but exactly one direct base class.

43. Duplicate __________ could result from __________.
   (a) subobjects, multiple inheritance
   (b) superobjects, multiple inheritance.
   (c) superclasses, downcasting a pointer.
   (d) subclasses, upcasting a pointer.

44. __________ inheritance solves the problem of duplicate subobjects.
45. For multiple inheritance, the __________ is responsible for initializing the ______ base class.
   (a) most derived class, virtual
   (b) least derived class, virtual
   (c) most derived class, const
   (d) first derived class, virtual

ANS: (b)
