

IS 0020  
Program Design and Software Tools  
Introduction to C++ Programming

Lecture 4: Classes

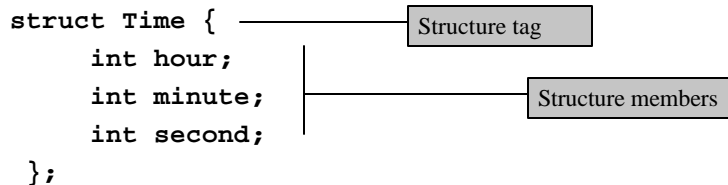

Jan 27, 2005

Structure Definitions

• Structures

- Aggregate data types built using elements of other types

```
struct Time {  
    int hour;  
    int minute;  
    int second;  
};
```

• Structure member naming

- In same **struct**: must have unique names
- In different **structs**: can share name

• **struct** definition must end with semicolon

## Structure Definitions

- Self-referential structure
  - Structure member cannot be instance of enclosing **struct**
  - Structure member can be pointer to instance of enclosing **struct** (self-referential structure)
    - Used for linked lists, queues, stacks and trees
- **struct** definition
  - Creates new data type used to declare variables
  - Structure variables declared like variables of other types
  - Examples:
    - `Time timeObject;`
    - `Time timeArray[ 10 ];`
    - `Time *timePtr;`
    - `Time &timeRef = timeObject;`

© 2003 Prentice Hall, Inc. All rights reserved.

## Accessing Structure Members

- Member access operators
  - Dot operator (.) for structure and class members
  - Arrow operator (->) for structure and class members via pointer to object
  - Print member **hour** of **timeObject**:
 

```
cout << timeObject.hour;
```

OR

```
timePtr = &timeObject;
cout << timePtr->hour;
```
  - `timePtr->hour` same as `( *timePtr ).hour`
    - Parentheses required
      - \* lower precedence than .

© 2003 Prentice Hall, Inc. All rights reserved.

## Implementing a User-Defined Type Time with a struct

5

- Default: structures passed by value
  - Pass structure by reference
    - Avoid overhead of copying structure
- C-style structures
  - No “interface”
    - If implementation changes, all programs using that **struct** must change accordingly
  - Cannot print as unit
    - Must print/format member by member
  - Cannot compare in entirety
    - Must compare member by member

© 2003 Prentice Hall, Inc. All rights reserved.

```
1 // Fig. 6.1: fig06_01.cpp
2 // Create a structure, set its members, and print it.
3 #include <iostream>
4
5 using std::cout;
6 using std::endl;
7
8 #include <iomanip>
9
10 using std::setfill;
11 using std::setw;
12
13 // structure definition
14 struct Time {
15     int hour; // 0-23 (24-hour clock format)
16     int minute; // 0-59
17     int second; // 0-59
18 }; // end struct Time
19
20
21 void printUniversal( const Time & ); // prototype
22 void printStandard( const Time & ); // prototype
23
```

Define structure type **Time** with three integer members.

Pass references to constant **Time** objects to eliminate copying overhead.

# Class

7

- Classes(keyword **class**)
  - Model objects
    - Attributes (data members)
    - Behaviors (member functions)
      - Methods
      - Invoked in response to messages
- Member access specifiers: **public**, **Private**, **protected**:
- Constructor function
  - Special member function
    - Initializes data members
    - Same name as class
  - Called when object instantiated
  - Several constructors
    - Function overloading
  - No return type

© 2003 Prentice Hall, Inc. All rights reserved.

# Implementing a Time Abstract Data Type with a class

8

## Objects of class

- After class definition
  - Class name new type specifier
  - Object, array, pointer and reference declarations
- Member functions defined outside class
  - Binary scope resolution (::)  
*ReturnType*  
*ClassName* : : *MemberFunctionName*(  
){...}
- Member functions defined inside class
  - Do not need scope resolution operator, class name
  - Compiler attempts inline
    - Outside class, inline explicitly with keyword **inline**

Class name becomes new type specifier.

```
Time sunset; // object of type Time
Time arrayOfTimes[ 5 ]; // array of Time objects
Time *pointerToTime; // pointer to a Time object
Time &dinnerTime = sunset; // reference to a Time object
```

© 2003 Prentice Hall, Inc. All rights reserved.

```

1 // Fig. 6.3: fig06_03.cpp
2 // Time class.
3 #include <iostream>
4
5 using std::cout;
6 using std::endl;
7
8 #include <iomanip>
9
10 using std::setfill;
11 using std::setw;
12
13 // Time abstract data type (ADT) definition
14 class Time {
15
16 public:
17     Time(); // constructor
18     void setTime( int, int, int ); // set hour, minute, second
19     void printUniversal(); // print universal-time format
20     void printStandard(); // print standard-time format
21

```

Define class **Time**.

## Outline

fig06\_03.cpp  
(1 of 5)

9

© 2003 Prentice Hall, Inc.  
All rights reserved.

```

22 private:
23     int hour; // 0 - 23 (24-hour clock format)
24     int minute; // 0 - 59
25     int second; // 0 - 59
26
27 }; // end class Time
28
29 // Time constructor initializes each data member
30 // ensures all Time objects start in a consistent state
31 Time::Time()
32 {
33     hour = minute = second = 0;
34
35 } // end Time constructor
36
37 // set new Time value using universal time, perform validity
38 // checks on the data values and set invalid values to zero
39 void Time::setTime( int h, int m, int s )
40 {
41     hour = ( h >= 0 && h < 24 ) ? h : 0;
42     minute = ( m >= 0 && m < 60 ) ? m : 0;
43     second = ( s >= 0 && s < 60 ) ? s : 0;
44
45 } // end function setTime
46

```

Constructor initializes  
**private** data members  
to 0.

**public** member  
function checks  
parameter values for  
validity before setting  
**private** data  
members.

## Outline

fig06\_03.cpp  
(2 of 5)

10

© 2003 Prentice Hall, Inc.  
All rights reserved.

```

47 // print Time in universal format
48 void Time::printUniversal()
49 {
50     cout << setfill( '0' ) << setw( 2 ) << hour << ":"
51         << setw( 2 ) << minute << ":"
52         << setw( 2 ) << second;
53
54 } // end function printUniversal
55
56 // print Time in standard format
57 void Time::printStandard()
58 {
59     cout << ( ( hour == 0 || hour == 12 ) ? 12 : hour % 12 )
60         << ":" << setfill( '0' ) << setw( 2 ) << minute
61         << ":" << setw( 2 ) << second
62         << ( hour < 12 ? " AM" : " PM" );
63
64 } // end function printStandard
65
66 int main()
67 {
68     Time t; // instantiate object t of class Time
69

```

No arguments (implicitly "know" purpose is to print data members); member function calls more concise.

Declare variable `t` to be object of class `Time`.

```

70 // output Time object t's initial values
71 cout << "The initial universal time is ";
72 t.printUniversal(); // 00:00:00
73
74 cout << "\nThe initial standard time is ";
75 t.printStandard(); // 12:00:00 AM
76
77 t.setTime( 13, 27, 6 ); // change time
78
79 // output Time object t's new values
80 cout << "\n\nUniversal time after setTime: ";
81 t.printUniversal(); // 13:27:06
82
83 cout << "\n\nStandard time after setTime: ";
84 t.printStandard(); // 1:27:06 PM
85
86 t.setTime( 99, 99, 99 ); // attempt invalid settings
87
88 // output t's values after specifying invalid values
89 cout << "\n\nAfter attempting invalid settings:"
90 << "\n\nUniversal time: ";
91 t.printUniversal(); // 00:00:00
92

```

Invoke **public** member functions to print time.

Set data members using **public** member function.

Attempt to set data members to invalid values using **public** member function.

```

93     cout << "\nStandard time: ";
94     t.printStandard();    // 12:00:00 AM
95     cout << endl;
96
97     return 0;
98
99 } // end main

```

```

The initial universal time is 00:00:00
The initial standard time is 12:00:00 AM

```

```

Universal time after setTime is 13:27:06
Standard time after setTime is 1:27:06 PM

```

```

After attempting invalid settings:
Universal time: 00:00:00
Standard time: 12:00:00 AM

```

Data members set to 0 after attempting invalid settings.

# Classes

14

- Destructors
  - Same name as class
    - Preceded with tilde (~)
  - No arguments
  - Cannot be overloaded
  - Performs “termination housekeeping”
- Advantages of using classes
  - Simplify programming
  - Interfaces
    - Hide implementation
  - Software reuse
    - Composition (aggregation)
      - Class objects included as members of other classes
    - Inheritance
      - New classes derived from old

© 2003 Prentice Hall, Inc. All rights reserved.

## Class Scope and Accessing Class Members

- Class scope
  - Data members, member functions
  - Within class scope
    - Class members
      - Immediately accessible by all member functions
      - Referenced by name
  - Outside class scope
    - Referenced through handles
      - Object name, reference to object, pointer to object
- File scope
  - Nonmember functions

## Class Scope and Accessing Class Members

- Function scope
  - Variables declared in member function
  - Only known to function
  - Variables with same name as class-scope variables
    - Class-scope variable “hidden”
      - Access with scope resolution operator (`::`)  
*ClassName::classVariableName*
  - Variables only known to function they are defined in
  - Variables are destroyed after function completion
- Operators to access class members
  - Identical to those for **structs**
  - Dot member selection operator (`.`)
    - Object
    - Reference to object
  - Arrow member selection operator (`->`)
    - Pointers

```

1 // Fig. 6.4: fig06_04.cpp
2 // Demonstrating the class member access operators . and ->
3 //
4 // CAUTION: IN FUTURE EXAMPLES WE AVOID PUBLIC DATA!
5 #include <iostream>
6
7 using std::cout;
8 using std::endl;
9
10 // class Count definition
11 class Count {
12
13 public:
14     int x;
15
16     void print()
17     {
18         cout << x << endl;
19     }
20
21 }; // end class Count
22

```

Data member `x` **public** to illustrate class member access operators; typically data members **private**.

## Separating Interface from Implementation

- Separating interface from implementation
  - Advantage: Easier to modify programs
  - Disadvantage
    - Header files
      - Portions of implementation: Inline member functions
      - Hints about other implementation: private members
    - Can hide more with proxy class
- Header files
  - Class definitions and function prototypes
  - Included in each file using class
    - **#include**
  - File extension **.h**
- Source-code files
  - Member function definitions
  - Same base name
    - Convention
  - Compiled and linked

## Controlling Access to Members

- Access modes
  - **private**
    - Default access mode
    - Accessible to member functions and **friends**
  - **public**
    - Accessible to any function in program with handle to class object
  - **protected** (later)
- Class member access
  - Default **private**
  - Explicitly set to **private**, **public**, **protected**
- **struct** member access
  - Default **public**
  - Explicitly set to **private**, **public**, **protected**

## Access Functions and Utility Functions

- Access to class's **private** data
  - Controlled with access functions (accessor methods)
    - Get function - Read **private** data
    - Set function - Modify **private** data
- Access functions
  - **public**
  - Read/display data
  - Predicate functions
    - Check conditions
- Utility functions (helper functions)
  - **private**
  - Support operation of **public** member functions
  - Not intended for direct client use

```

1 // Fig. 6.9: salesp.h
2 // SalesPerson class definition.
3 // Member functions defined in salesp.cpp.
4 #ifndef SALESP_H
5 #define SALESP_H
6
7 class SalesPerson {
8
9 public:
10     SalesPerson();           // construct
11     void getSalesFromUser(); // input sales from keyboard
12     void setSales( int, double ); // set sales
13     void printAnnualSales(); // summarize
14
15 private:
16     double totalAnnualSales(); // utility function
17     double sales[ 12 ];        // 12 monthly sales figures
18
19 }; // end class SalesPerson
20
21 #endif

```

Set access function performs validity checks.

private utility function.

```

25 // get 12 sales figures from the user at the keyboard
26 void SalesPerson::getSalesFromUser()
27 {
28     double salesFigure;
29
30     for ( int i = 1; i <= 12; i++ ) {
31         cout << "Enter sales amount for month " << i << ": ";
32         cin >> salesFigure;
33         setSales( i, salesFigure );
34     } // end for
35 } // end function getSalesFromUser
36
37 // set one of the 12 monthly sales figures; function subtracts
38 // one from month value for proper subscript
39 void SalesPerson::setSales( int month, double amount )
40 {
41     // test for valid month and amount values
42     if ( month >= 1 && month <= 12 && amount > 0 )
43         sales[ month - 1 ] = amount; // adjust for subscripts 0-11
44     else // invalid month or amount value
45         cout << "Invalid month or sales figure" << endl;
46 }

```

Set access function performs validity checks.

## Initializing Class Objects: Constructors

- Constructors
  - Initialize data members; no return type
    - Or can set later
  - Same name as class
  - Can specify default arguments
  - Default constructors
    - Defaults all arguments

OR

    - Explicitly requires no arguments
    - Can be invoked with no arguments
    - Only one per class
- Initializers
  - Passed as arguments to constructor
  - In parentheses to right of class name before semicolon  
*Class-type ObjectName( value1,value2,...);*

© 2003 Prentice Hall, Inc. All rights reserved.

```

1 // Fig. 6.12: time2.h
2 // Declaration of class Time.
3 // Member functions defined in time2.cpp.
4
5 // prevent multiple inclusions of header file
6 #ifndef TIME2_H
7 #define TIME2_H
8
9 // Time abstract data type definition
10 class Time {
11
12 public:
13     Time( int = 0, int = 0, int = 0); // default constructor
14     void setTime( int, int, int ); // set hour, minute, second
15     void printUniversal(); // print universal-time format
16     void printStandard(); // print standard-time format
17
18 private:
19     int hour; // 0 - 23 (24-hour clock format)
20     int minute; // 0 - 59
21     int second; // 0 - 59
22
23 }; // end class Time
24
25 #endif

```

Default constructor  
specifying all arguments.

All rights reserved.

```

23 // set new Time value using universal time, perform validity
24 // checks on the data values and set invalid values to zero
25 void Time::setTime( int h, int m, int s )
26 {
27     hour = ( h >= 0 && h < 24 ) ? h : 0;
28     minute = ( m >= 0 && m < 60 ) ? m : 0;
29     second = ( s >= 0 && s < 60 ) ? s : 0;
30 }
31 // end function setTime
32
33 // print Time in universal format
34 void Time::printUniversal()
35 {
36     cout << setfill( '0' ) << setw( 2 ) << hour << ":"
37         << setw( 2 ) << minute << ":"
38         << setw( 2 ) << second;
39 }
40 // end function printUniversal
41

```

## Outline

26

time2.cpp (2 of 3)

© 2003 Prentice Hall, Inc.  
All rights reserved.

```

1 // Fig. 6.14: fig06_14.cpp
2 // Demonstrating a default constructor for class Time.
3 #include <iostream>
4
5 using std::cout;
6 using std::endl;
7
8 // include definition of class Time from time2.h
9 #include "time2.h"
10
11 int main()
12 {
13     Time t1;           // all arguments defaulted
14     Time t2( 2 );     // minute and second defaulted
15     Time t3( 21, 34 ); // second defaulted
16     Time t4( 12, 25, 42 ); // all values specified
17     Time t5( 27, 74, 99 ); // all bad values specified
18
19     cout << "Constructed with:\n\n"
20          << "all default arguments:\n ";
21     t1.printUniversal(); // 00:00:00
22     cout << "\n ";
23     t1.printStandard(); // 12:00:00 AM
24

```

Initialize **Time** objects using default arguments.

Initialize **Time** object with invalid values; validity checking will set values to 0.

```

25     cout << "\n\nhour specified; default minute and second:\n ";
26     t2.printUniversal(); // 02:00:00
27     cout << "\n ";
28     t2.printStandard(); // 2:00:00 AM
29
30     cout << "\n\nhour and minute specified; default second:\n ";
31     t3.printUniversal(); // 21:34:00
32     cout << "\n ";
33     t3.printStandard(); // 9:34:00 PM
34
35     cout << "\n\nhour, minute, and second specified:\n ";
36     t4.printUniversal(); // 12:25:42
37     cout << "\n ";
38     t4.printStandard(); // 12:25:42 PM
39
40     cout << "\n\nall invalid values specified:\n ";
41     t5.printUniversal(); // 00:00:00
42     cout << "\n ";
43     t5.printStandard(); // 12:00:00 AM
44     cout << endl;
45
46     return 0;
47
48 } // end main

```

t5 constructed with invalid arguments; values set to 0.

## Destructors

- Destructors
  - Special member function
  - Same name as class preceded with tilde (~)
  - No arguments; No return value
  - Cannot be overloaded
  - Performs “termination housekeeping”
    - Before system reclaims object’s memory
      - Reuse memory for new objects
  - No explicit destructor
    - Compiler creates “empty destructor”
- Constructors and destructors - *Called implicitly by compiler*
- Order of function calls
  - Depends on when execution enters and exits scope of objects
  - Generally, destructor calls reverse order of constructor calls

## When Constructors and Destructors Are Called

- Global scope objects
  - Constructors - *Before any other function* (including **main**)
  - Destructors
    - When **main** terminates (or **exit** function called)
    - Not called if program terminates with **abort**
  - Automatic local objects
    - Constructors - *When objects defined & each time execution enters scope*
    - Destructors
      - When objects leave scope
        - Execution exits block in which object defined
      - Not called if program ends with **exit** or **abort**
    - **static** local objects
      - Constructors
        - Exactly once
        - When execution reaches point where object defined
      - Destructors
        - When **main** terminates or **exit** function called
        - Not called if program ends with **abort**

```

1 // Fig. 6.17: fig06_17.cpp
2 // Demonstrating the order in which constructors and
3 // destructors are called.
4 #include <iostream>
5
6 using std::cout;
7 using std::endl;
8
9 // include CreateAndDestroy class definition from create.h
10 #include "create.h"
11
12 void create( void ); // prototype
13
14 // global object
15 CreateAndDestroy first( 1, "(global before main)" );
16
17 int main()
18 {
19     cout << "\nMAIN FUNCTION: EXECUTION BEGINS" << endl;
20
21     CreateAndDestroy second( 2, "(local automatic in main)" );
22
23     static CreateAndDestroy third(
24         3, "(local static in main)" );
25

```

Create variable with global scope.

Create local automatic object.

Create **static** local object.

```

26 create(); // call function to create objects
27
28 cout << "\nMAIN FUNCTION: EXECUTION RESUMES" << endl;
29
30 CreateAndDestroy fourth( 4, "(local automatic in main)" );
31
32 cout << "\nMAIN FUNCTION: EXECUTION ENDS" << endl;
33
34 return 0;
35
36 } // end main
37
38 // function to create objects
39 void create( void )
40 {
41     cout << "\nCREATE FUNCTION: EXECUTION BEGINS" << endl;
42
43     CreateAndDestroy fifth( 5, "(local automatic in create)" );
44
45     static CreateAndDestroy sixth( 6, "(local static in create)" );
46
47     CreateAndDestroy seventh( 7, "(local automatic in create)" );
48
49     cout << "\nCREATE FUNCTION: EXECUTION ENDS" << endl;
50
51 } // end function create
52
53

```

Create local automatic objects.

Create local automatic object.

Create local automatic object in function.

Create **static** local object in function.

Create local automatic object in function.

33

▲ Outline ▼

fig06\_17.cpp  
output (1 of 1)

```

Object 1  constructor runs  (global before main)

MAIN FUNCTION: EXECUTION BEGINS
Object 2  constructor runs  (local automatic in main)
Object 3  constructor runs  (local static in main)

CREATE FUNCTION: EXECUTION BEGINS
Object 5  constructor runs  (local automatic in create)
Object 6  constructor runs  (local static in create)
Object 7  constructor runs  (local automatic in create)

CREATE FUNCTION: EXECUTION ENDS
Object 7  destructor runs  (local automatic in create)
Object 5  destructor runs  (local automatic in create)

MAIN FUNCTION: EXECUTION RESUMES
Object 4  constructor runs  (local automatic in main)

MAIN FUNCTION: EXECUTION ENDS
Object 4  destructor runs  (local automatic in main)
Object 2  destructor runs  (local automatic in main)
Object 6  destructor runs  (local static in create)
Object 3  destructor runs  (local static in main)

Object 1  destructor runs  (global before main)

```

Local **static** object exists

Global object constructed

Local **automatic** object

Local **static** object constructed on first function call and destroyed after **main** execution ends.

34

## Using *Set* and *Get* Functions

- Set functions
  - Perform validity checks before modifying **private** data
  - Notify if invalid values
  - Indicate with return values
- Get functions
  - “Query” functions
  - Control format of data returned

© 2003 Prentice Hall, Inc. All rights reserved.

## Subtle Trap: Returning a Reference to a private Data Member

35

- Reference to object
  - &pRef = p;
  - Alias for name of object
  - Lvalue
    - Can receive value in assignment statement
      - Changes original object
- Returning references
  - **public** member functions can return non-**const** references to **private** data members
    - Client able to modify **private** data members

© 2003 Prentice Hall, Inc. All rights reserved.

```
1 // Fig. 6.21: time4.h
2 // Declaration of class Time.
3 // Member functions defined in time4.cpp
4
5 // prevent multiple inclusions of header file
6 #ifndef TIME4_H
7 #define TIME4_H
8
9 class Time {
10
11 public:
12     Time( int = 0, int = 0, int = 0 );
13     void setTime( int, int, int );
14     int getHour();
15
16     int &badSetHour( int ); // DANGEROUS reference return
17
18 private:
19     int hour;
20     int minute;
21     int second;
22
23 }; // end class Time
24
25 #endif
```

Function to demonstrate effects of returning reference to **private** data member.

Outline

36

time4.h (1 of 1)

© 2003 Prentice Hall, Inc.  
All rights reserved.

```

25 // return hour value
26 int Time::getHour()
27 {
28     return hour;
29 }
30 } // end function getHour
31
32 // POOR PROGRAMMING PRACTICE:
33 // Returning a reference to a private data member.
34 int &Time::badSetHour( int hh )
35 {
36     hour = ( hh >= 0 && hh < 24
37     return hour; // DANGEROUS reference return
38 }
39
40 } // end function badSetHour

```

Return reference to private data member hour.

Outline

37

time4.cpp (2 of 2)

© 2003 Prentice Hall, Inc. All rights reserved.

```

1 // Fig. 6.23: fig06_23.cpp
2 // Demonstrating a public member function that
3 // returns a reference to a private data member.
4 #include <iostream>
5
6 using std::cout;
7 using std::endl;
8
9 // include definition of class Time from time4.h
10 #include "time4.h"
11
12 int main()
13 {
14     Time t;
15
16     // store in hourRef the reference returned by badSetHour
17     int &hourRef = t.badSetHour( 20 );
18
19     cout << "Hour before modification: " << t.getHour();
20
21     // use hourRef to set invalid
22     hourRef = 30;
23
24     cout << "\nHour after modification: " << t.getHour();
25

```

badSetHour returns reference to private data member hour.

Reference allows setting of private data member hour.

Outline

38

fig06\_23.cpp (1 of 2)

© 2003 Prentice Hall, Inc. All rights reserved.

```

26 // Dangerous: Function call that returns
27 // a reference can be used as an lvalue!
28 t.badSetHour( 12 ) = 74;
29
30 cout << "\n\n*****"
31 << "POOR PROGRAMMING PRACTICE!!!"
32 << "badSetHour as an lvalue, Hour: "
33 << t.getHour()
34 << "\n*****" << endl;
35
36 return 0;
37
38 } // end main

```

Can use function call as lvalue to set invalid value.

```

Hour before modification: 20
Hour after modification: 30

*****
POOR PROGRAMMING PRACTICE!!!!!!!!!!
badSetHour as an lvalue, Hour: 74
*****

```

Returning reference allowed invalid setting of **private** data member **hour**.

## Default Memberwise Assignment

- Assigning objects
  - Assignment operator (=)
    - Can assign one object to another of same type
    - Default: memberwise assignment
      - Each right member assigned individually to left member
- Passing, returning objects
  - Objects passed as function arguments
  - Objects returned from functions
  - Default: pass-by-value
    - Copy of object passed, returned
      - Copy constructor
      - Copy original values into new object

```

1 // Fig. 6.24: fig06_24.cpp
2 // Demonstrating that class objects can be assigned
3 // to each other using default memberwise assignment.
4 #include <iostream>
5
6 using std::cout;
7 using std::endl;
8
9 // class Date definition
10 class Date {
11
12 public:
13     Date( int = 1, int = 1, int = 1990 ); // default constructor
14     void print();
15
16 private:
17     int month;
18     int day;
19     int year;
20
21 }; // end class Date
22

```

## Software Reusability

- Software reusability

- Class libraries
  - Well-defined
  - Carefully tested
  - Well-documented
  - Portable
  - Widely available
- Speeds development of powerful, high-quality software
  - Rapid applications development (RAD)
- Resulting problems
  - Cataloging schemes
  - Licensing schemes
  - Protection mechanisms

## const (Constant) Objects and const Member Functions

43

- Keyword **const**
  - Specify object not modifiable
  - Compiler error if attempt to modify **const** object
  - Example

```
const Time noon( 12, 0, 0 );
```

    - Declares **const** object **noon** of class **Time**
    - Initializes to 12
- **const** member functions
  - Member functions for **const** objects must also be **const**
    - Cannot modify object
  - Specify **const** in both prototype and definition
    - Prototype
      - After parameter list
    - Definition
      - Before beginning left brace

© 2003 Prentice Hall, Inc. All rights reserved.

## const (Constant) Objects and const Member Functions

44

- Constructors and destructors
  - Cannot be **const**
  - Must be able to modify objects
    - Constructor
      - Initializes objects
    - Destructor
      - Performs termination housekeeping
- Member initializer syntax
  - Initializing with member initializer syntax
    - Can be used for
      - All data members
    - Must be used for
      - **const** data members
      - Data members that are references

© 2003 Prentice Hall, Inc. All rights reserved.

```

1 // Fig. 7.4: fig07_04.cpp
2 // Using a member initializer to initialize a
3 // constant of a built-in data type.
4 #include <iostream>
5
6 using std::cout;
7 using std::endl;
8
9 class Increment {
10
11 public:
12     Increment( int c = 0, int i = 1 ); // default constructor
13
14     void addIncrement()
15     {
16         count += increment;
17     } // end function addIncrement
18
19     void print() const; // prints count and increment
20
21

```

```

22 private:
23     int count;
24     const int increment; // const data member
25
26 }; // end class Increment
27
28 // constructor
29 Increment::Increment(
30     int c, // initial value
31     int i // required increment
32 ) {
33     // empty body
34 } // end Increment constructor
35
36 // print count and increment values
37 void Increment::print() const
38 {
39     cout << "count = " << count
40         << ", increment = " << increment << endl;
41 } // end function print
42
43
44

```

Member initializer list separated by colon.

Member initializer syntax can be used for **const** data member **increment**.

Member initializer syntax must be used for **const** data member **increment**.

Member initializer consists of data member name (**increment**) followed by parentheses containing initial value (**c**).

## Composition: Objects as Members of Classes

### Composition

- Class has objects of other classes as members
- Construction of objects
  - Member objects constructed in order declared
    - Not in order of constructor's member initializer list
    - Constructed before enclosing class objects (host objects)

```

1 // Fig. 7.6: date1.h
2 // Date class definition.
3 // Member functions defined in date1.cpp
4 #ifndef DATE1_H
5 #define DATE1_H
6
7 class Date {
8
9 public:
10     Date( int = 1, int = 1, int =
11     void print() const; // print
12     ~Date(); // provided to confirm destruction order
13
14 private:
15     int month; // 1-12 (January-December)
16     int day; // 1-31 based on month
17     int year; // any year
18
19     // utility function to test proper day for month and year
20     int checkDay( int ) const;
21
22 }; // end class Date
23
24 #endif

```

Note no constructor with parameter of type **Date**. Recall compiler provides default copy constructor.

[Outline](#)

48

date1.h (1 of 1)

```

1 // Fig. 7.8: employee1.h
2 // Employee class definition.
3 // Member functions defined in employee1.cpp.
4 #ifndef EMPLOYEE1_H
5 #define EMPLOYEE1_H
6
7 // include Date class definition from date1.h
8 #include "date1.h"
9
10 class Employee {
11
12 public:
13     Employee(
14         const char *, const char *, const Date &, const Date & );
15
16     void print() const;
17     ~Employee(); // provided to confirm destruction order
18
19 private:
20     char firstName[ 25 ];
21     char lastName[ 25 ];
22     const Date birthDate; // composition: member object
23     const Date hireDate; // composition: member object
24
25 }; // end class Employee

```

Using composition;  
**Employee** object contains  
**Date** objects as data  
members.

```

13 // constructor uses member initializer list to pass initializer
14 // values to constructors of member objects birthDate and
15 // hireDate [Note: This invokes the so-called "default copy
16 // constructor" which the C++ compiler provides implicitly.]
17 Employee::Employee( const char *first, const char *last,
18     const Date &dateOfBirth, const Date &dateOfHire )
19     : birthDate( dateOfBirth ), // initialize birthDate
20     hireDate( dateOfHire ) // initialize hireDate
21 {
22     // copy first into firstName and be sure
23     int length = strlen( first );
24     length = ( length < 25 ? length : 24 );
25     strncpy( firstName, first, length );
26     firstName[ length ] = '\0';
27
28     // copy last into lastName and be sure that it fits
29     length = strlen( last );
30     length = ( length < 25 ? length : 24 );
31     strncpy( lastName, last, length );
32     lastName[ length ] = '\0';
33
34     // output Employee object to show when constructor is called
35     cout << "Employee object constructor: "
36         << firstName << " " << lastName << endl;
37

```

Member initializer syntax to  
initialize **Date** data members  
**birthDate** and  
**hireDate**; compiler uses  
default copy constructor.

Output to show timing of  
constructors.

```
1 // Fig. 7.10: fig07_10.cpp
2 // Demonstrating composition--an object with member objects.
3 #include <iostream>
4
5 using std::cout;
6 using std::endl;
7
8 #include "employee1.h" // Employee class definition
9
10 int main()
11 {
12     Date birth( 7, 24, 1949 );
13     Date hire( 3, 12, 1988 );
14     Employee manager( "Bob", "Jones", birth, hire );
15
16     cout << '\n';
17     manager.print();
18
19     cout << "\nTest Date constructor with invalid values:\n";
20     Date lastDayOff( 14, 35, 1994 ); // invalid month and day
21     cout << endl;
22
23     return 0;
24
25 } // end main
```

Create **Date** objects to pass to **Employee** constructor.
