Lecture 4<br>Jan 30, 2013

Access Control Model
Foundational Results

## Objective

- Understand the basic results of the HRU model
- Saftey issue
- Turing machine
- Undecidability

## Safety Problem: formally

Given

- Initial state $X_{0}=\left(S_{0,} O_{0,} A_{0}\right)$
- Set of primitive commands $c$
- $r$ is not in $A_{d}[s, o]$
- Can we reach a state $X_{n}$ where
- $\exists s, o$ such that $A_{n}[s, o]$ includes a right $r$ not in $A_{[ }[s, 0]$ ?

If so, the system is not safe But is "safe" secure?

## Undecidable Problems

- Decidable Problem
- A decision problem can be solved by an algorithm that halts on all inputs in a finite number of steps.
- Undecidable Problem
- A problem that cannot be solved for all cases by any algorithm whatsoever

## Decidability Results (Harrison, Ruzzo, Ullman)

- Theorem:
- Given a system where each command consists of a single primitive command (mono-operational), there exists an algorithm that will determine if a protection system with initial state $X_{0}$ is safe with respect to right $r$.

## Decidability Results (Harrison, Ruzzo, Ullman)

- Proof: determine minimum commands $k$ to leak
- Delete/destroy: Can't leak
- Create/enter: new subjects/objects "equal", so treat all new subjects as one
- No test for absence of right
- Tests on $A\left[s_{1}, o_{1}\right]$ and $A\left[s_{2}, o_{2}\right]$ have same result as the same tests on $A\left[s_{1}, o_{1}\right]$ and $A\left[s_{1}, o_{2}\right]=A\left[s_{1}, o_{2}\right] \cup A\left[s_{2}, o_{2}\right]$
- If $n$ rights leak possible, must be able to leak $k=$ $n\left(\left|S_{0}\right|+1\right)\left(\left|O_{0}\right|+1\right)+1$ commands
- Enumerate all possible states to decide

## Create Statements

Create $s_{1}$; Create $s_{2}$

Discard these

## Create Statements

## Decidability Results (Harrison, Ruzzo, Ullman)

- Proof: determine minimum commands $k$ to leak
- Delete/destroy: Can't leak
- Create/enter: new subjects/objects "equal", so treat all new subjects as one
- No test for absence of right
- Tests on $A\left[s_{1}, o_{1}\right]$ and $A\left[s_{2}, o_{2}\right]$ have same result as the same tests on $A\left[s_{1}, o_{1}\right]$ and $A\left[s_{1}, o_{2}\right]=A\left[s_{1}, o_{2}\right] \cup A\left[s_{2}, o_{2}\right]$
- If $n$ rights leak possible, must be able to leak $k=$ $n\left(\left|S_{0}\right|+1\right)\left(\left|O_{0}\right|+1\right)+1$ commands
- Enumerate all possible states to decide

## Decidability Results <br> (Harrison, Ruzzo, Ullman)

- It is undecidable if a given state of a given protection system is safe for a given generic right
- For proof - need to know Turing machines and halting problem

## Turing Machine \& halting problem

- The halting problem:
- Given a description of an algorithm and a description of its initial arguments, determine whether the algorithm, when executed with these arguments, ever halts (the alternative is that it runs forever without halting).

## Turing Machine \& Safety problem

- Theorem:
- It is undecidable if a given state of a given protection system is safe for a given generic right
- Reduce TM to Safety problem
- If Safety problem is decidable then it implies that TM halts (for all inputs) - showing that the halting problem is decidable (contradiction)
- TM is an abstract model of computer
- Alan Turing in 1936

## Turing Machine

- TM consists of
- A tape divided into cells; infinite in one direction
- A set of tape symbols $M$
- $M$ contains a special blank symbol $b$
- A set of states $K$

- A head that can read and write symbols
- An action table that tells the machine how to transition
- What symbol to write
- How to move the head ('L' for left and 'R' for right)
- What is the next state

## Turing Machine

- Transition function $\delta(k, m)=$ $\left(k^{\prime}, m^{\prime}, \mathrm{L}\right)$ :
- In state $k$, symbol $m$ on tape location is replaced by symbol $m^{\prime}$,
- Head moves one cell to the left, and TM enters state $k^{\prime}$
- Halting state is $q_{f}$
- TM halts when it enters this state

Let $\delta(k, C)=\left(k_{1}, X, R\right)$ where $k_{1}$ is the next state

## Turing Machine

Let $\delta(k, C)=\left(k_{1}, X, R\right)$

head

Current state is $k$
Current symbol is $C$

Let $\delta\left(k_{1}, D\right)=\left(k_{2}, Y, L\right)$ where $k_{2}$ is the next state

## TM2Safety Reduction

Current state is $k$
Current symbol is $C$ head
Proof: Reduce TM to safety problem

- Symbols, States $\Rightarrow$ rights
- Tape cell $\Rightarrow$ subject
- Cell $s_{i}$ has $A \Rightarrow s_{i}$ has $A$ rights on itself
- Cell $s_{k} \Rightarrow s_{k}$ has end rights on itself
- State $p_{\text {, }}$ head at $s_{i} \Rightarrow s_{i}$ has $p$ rights on itself
- Distinguished Right own:
- $s_{i}$ owns $s_{i}+1$ for $1 \leq i<k$

|  | $s_{1}$ | $s_{2}$ | $s_{3}$ | $s_{4}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $s_{1}$ | A | $o w n$ |  |  |  |

| $s_{4}$ |  |  |  | Y | $o w n$ |
| $s_{5}$ |  |  |  |  | $\mathrm{~b} k_{2}$ end |

## Rest of Proof

- Protection system exactly simulates a TM
- Exactly 1 end right in ACM
- Only 1 right corresponds to a state
- Thus, at most 1 applicable command in each configuration of the TM
- If TM enters state $q_{f}$ then right has leaked
- If safety question decidable, then represent TM as above and determine if $q_{f}$ leaks
- Leaks halting state $\Rightarrow$ halting state in the matrix $\Rightarrow$ Halting state reached
- Conclusion: safety question undecidable

## Other results

- For protection system without the create primitives, (i.e., delete create primitive); the safety question is complete in P-SPACE
- It is undecidable whether a given configuration of a given monotonic protection system is safe for a given generic right
- Delete destroy, delete primitives;
- The system becomes monotonic as they only increase in size and complexity
- The safety question for biconditional monotonic protection systems is undecidable
- The safety question for monoconditional, monotonic protection systems is decidable
- The safety question for monoconditional protection systems with create, enter, delete (and no destroy) is decidable.
